

### SMTPmail Sets Industry Standard

SoftArtisans SMTPmail is a full-featured e-mail client component, written in high-performance C++. With its newest version, this award-winning control continues to outperform all other SMTP components.

The screenshot shows a web-based form for sending an email. It includes the following fields: RemoteHost (with a placeholder 'Your SMTP server'), From Name, From Address, Subject, Recipient's Name, and Recipient's E-mail. Below these is a large text area for the message body with the placeholder 'Enter message body here.'. At the bottom, there is an 'Attachment:' field with a 'Browse...' button and a 'Send Mail w/ Attachment' button.

*Build applications that send e-mail from any client!*

### SMTPmail Wins for Second Straight Year!

SoftArtisans SMTPmail was honored by Visual Studio Magazine at its annual Readers Choice Awards Ceremony at VSLive! 2002. Chosen by VSM's readers, SMTPmail won the Readers Choice Merit Award in the category of Fax, Messaging, & Telephony.

### SMTPmail Named 5-Star Component!

vbPlanet.net reviewed SoftArtisans SMTPmail and awarded them their "Must Have - Five Star Component" for outstanding scalability, robustness, reliability, and value.

### MassMail Feature

SMTPmail's MassMail feature works like a mail merge to send e-mail messages to a mailing list with only one connection to the mail server. This allows you to easily personalize each outgoing email with your database values. Any part of the message body or subject can be personalized. Even HTML and text mail can be personalized in the same message.

### Licensing

SoftArtisans SMTPmail is licensed and priced on a per-server basis. A server license is required on each server where SoftArtisans software is installed. An additional license is required for every development PC, even if it is a test machine, where the product is installed. There are no per-user, per IP address, or per Web site licenses.

### FEATURES & BENEFITS

- Send e-mail from any COM client
- Supports all threading models
- Pretty Good Privacy (PGP) is supported.
- Supports common functions:
  - o File attachments
  - o HTML-format emails
